WEAKEST

- Straight:**
Five consecutive cards of different suits.
- Three of a Kind:**
Three cards of the same rank.
- Two Pairs:**
Two sets of two cards with the same rank.
- One Pair:**
Two cards of the same rank.
- High Card:**
The highest card in the hand

Poker terminology

Limp

Calling the Minimum
Bet Without Raising

Pre flop raise(pfr)

Increasing the Bet

Big blind(bb)

mandatory
fee

3 bet

Re-Raising
After a raise

4 bet

Re-Raising
After 2 raises

bb/100:

Measures winnings per 100 hands
 $1bb/100 = 0.20$ cents per 100 hands
 $10bb/100 = 2$ euros per 100 hands
 $-10bb/100 = -2$ euros per 100 hands

Voluntarily put money in pot(VPIP)

Percentage of Hands a Player plays

Background and Methodology

01

Project Details

The primary goal of this project was to dive into players behavior in online poker, focusing on the NL 25 room of PokerKing.

By analyzing strategies employed during gameplay, we aimed to uncover insights into winning and losing player dynamics.

02

Data Details

We acquired a substantial dataset of 1.5 million poker hands from HH dealer.

This raw data was then transformed into a usable format through PokerTracker, facilitating its analysis. The dataset was further refined and processed using Jupyter Notebook and SQL to draw meaningful conclusions.

03

Hypothesis testing

Our project's hypothesis centered around understanding which specific gameplay statistics had the most influence on winnings and losses.

Through rigorous statistical testing, we aimed to pinpoint these influential factors and establish their significance in player performance.

04

Logistic regression

To gain a deeper understanding of player types, we classified participants as either "sharks" (successful players) or "fishes" (less successful players) based on their in-game winnings.

Utilizing logistic regression, we modeled the relationships between various statistics and player classification, improving our insights into the distinct strategies adopted by different player categories.

Key findings on hypothesis testing

Null Hypothesis (H0): The means of all the statistics are the same for "Fish" players compared to "Shark" players.

Alternative Hypothesis (Ha): At least one of the means of all the statistics are different for "Fish" players compared to "Shark" players.

With a 95% confidence level, **the results indicated that the means of several statistics significantly differ between "Fish" and "Shark" players** therefore **we reject H0 and confirm the Ha:**(At least one of the means of all the statistics are different for "Fish" players compared to "Shark" players.)

Sharks(winning players)

- Play less hands in general (VIP mean : 24.8%)
- Call less hands (Call any preflop raise mean: 13.5%)
- Make less limps (Limp mean: 1.1%)
- Are more aggressive when playing
(3 bet mean: 8.7%)(4bet mean: 7.65%)
- Give up more versus aggression when playing
(Fold to 3 bet mean: 75%) (Fold to 4 bet + mean: 60%)

Fishes(Losing players)

- Play more hands in general (VIP mean : 28.8%)
- Call more hands (Call any preflop raise mean:21.4%)
- Make more limps (Limp mean: 4.5%)
- Are less aggressive when playing
(3 bet mean:7.7%)(4bet mean: 6.2%)
- Give up less versus aggression when playing
(Fold to 3 bet mean: 70.5%) (Fold to 4 bet + mean: 56.8%)

Diving deeper into findings

Sharks(winning players)

- Play less hands in general (VIP mean : 24.8%)
- Call less hands (Call any preflop raise mean: 13.5%)
- Make less limps (Limp mean: 1.1%)
- Are more aggressive when playing (3 bet mean: 8.7%)(4bet mean: 7.65%)
- Give up more versus aggression when playing (Fold to 3 bet mean: 75%) (Fold to 4 bet + mean: 60%)

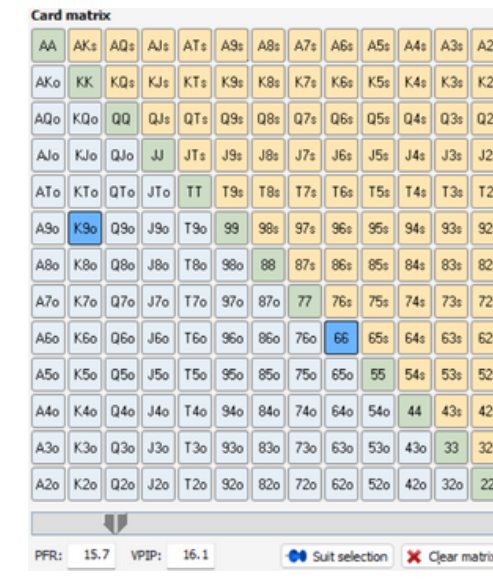

Avg Played hands by sharks (VIP)

Avg call any preflop raise by sharks(cpfr)

Avg limp by sharks

Fishes(Losing players)

- Play more hands in general (VIP mean : 28.8%)
- Call more hands (Call any preflop raise mean:21.4%)
- Make more limps (Limp mean: 4.5%)
- Are less aggressive when playing (3 bet mean:7.7%)(4bet mean: 6.2%)
- Give up less versus aggression when playing (Fold to 3 bet mean: 70.5%) (Fold to 4 bet + mean: 56.8%)

List of hands that Fishes limp and sharks don't:

Logistic regression

Our logistic regression model was designed to predict player types (Fish or Shark) based on significant gameplay statistics(discovered on hypothesis testing).

While achieving an accuracy of 65.59%, which signifies a moderate performance in classifying players, we observed certain variations in precision, recall, and F1-score metrics.

For Fish players, the model achieved a precision of 0.75, indicating that out of the instances predicted as Fish, 75% were indeed Fish. The recall for Fish was 0.67, meaning that the model identified 67% of actual Fish players. The F1-score, a harmonic mean of precision and recall, was 0.71 for Fish.

For Shark players, the precision was 0.54, signifying that 54% of instances predicted as Sharks were truly Sharks. The recall for Sharks was 0.63, indicating that the model successfully identified 63% of actual Shark players. The F1-score for Sharks was 0.58.

On what concerns to the confusion matrix, there were 38 instances of Fish players misclassified as Sharks, and 26 instances of Shark players misclassified as Fish.

Avg
winnings/100
hands

Average winnings bb/100 by type:
Fishes: -19.88 == $-(0.25 \times 19.88)$ == Lose 4.97\$ per 100 hands on average
Sharks: 10.15 == $0.25 + 10.15$ == Win 2.54\$ every 100 hands on average

Lab: Identifying fishes through statistics

Read Me: The goal of this lab is to identify if a player is likely to be a fish or a shark and state at least 3 reasons for your decision.

Next to each player , you will be able to see a HUD(Heads-up Display) a tool frequently used by poker players to visualize each player statistics.

Hints:

Fishes (Losing players) profiling according to our findings:

- Play more hands in general (bigger VPIP%)
- Call more hands (bigger Call any preflop raise%)
- Make more limps (bigger Limp%)
- Are less aggressive when playing (smaller 3 bet%)(smaller 4bet%)
- Give up less versus aggression when playing (smaller Fold to 3 bet %) (smaller Fold to 4 bet%)
